

- “textInput” is the text in the text field • “textInputTitle” is the text left of the text field •
- “itemList” is the result list. • “itemListTitle” is the title of a single item, e.g. “Scrivener”. •
- “itemListSubtitle” is the subtitle of a single item, e.g. Scrivener’s path. • “itemListExtraDetails” are the details on the right without a bubble around them, e.g. when you select an app and browse its info by using $\hat{\rightarrow}$, you see things like “Version”, “Name” or “Path”. •
- “itemListLabeledExtraDetails” are the details on the right with a bubble around them, e.g. when you select an app and browse its info by using $\hat{\rightarrow}$, you see things like the Info.plist or User Defaults entry with something like “Dictionary (xx items)”.
- You can reference other key’s values by setting the value to a key prefixed with an @, e.g.:
@" itemListTitleTextColor" : @" @defaultTextColor"
- Colors can be RGB or RGBA values (components separated by a space), hex values (prefixed with #, also: hex values with alpha!), a color name like “redColor” or “controlTextColor”, or an image name (used as a pattern image).
- Keys with an @2x suffix are only used on Retina displays, keys with an @1x suffix are only used on non-Retina displays.
- You can do calculations like @" someKey" : @" 2 * (@ textInputFontSize + 2.5)"

```
